| 85+ | 4,058 | 6.0 | 5,758 | 6.9 | 4,949 | 6.6 |

The column l_x shows, for each sex, the number of persons who would survive to exact age x out of 10,000 born who were subject throughout their lives to the recorded age death rates of the period. Column ${}^o e_x$ is the 'expectation of life', that is the average remaining lifetime for a person who survives at the beginning of the indicated age interval, if likewise subject to those death rates.
