Abridged Life Tables of Pakistan and Provinces by Sex, 1962

by

MUHAMMAD ASLAM

SULTAN S. HASHMI

AND

WILLIAM SELTZER*

INTRODUCTION

Mortality in a population is measured by a number of demographic indices such as the crude death rate, the infant mortality rate, the age-specific death rate or the standardised death rate. Still another more comprehensive method of portraying mortality conditions in a population is by means of a life table. A life table as compared to other mortality indices serves many useful purposes. For measuring longevity of life, projecting current population into the future or estimating incidence of widowhood and orphanhood, a life table is essential. For comparison of expectation of life (or average duration of life) at birth and after birth for various ages of different populations the life table is also commonly used. Besides its utility in demographic problems, still another important use of a life table is made by actuaries in life insurance. The life table is also becoming an important tool of investigation for problems of commerce and industry as it enables one to describe the expectation of life of many non-human populations. For detailed discussion of various kinds of life tables and their uses, the reader is advised to refer to any one of many standard reference works [6, Chapters 12 and 13].

*The authors are Chief, Demographic and Social Statistics Division, Central Statistical Office, Government of Pakistan; Senior Research Demographer, Pakistan Institute of Development Economics (also Principal Investigator of Population Growth Estimation Project) and Research Advisor, Population Growth Estimation Project, respectively. The authors wish to acknowledge the support of the Central Statistical Office (CSO), Government of Pakistan, the Pakistan Institute of Development Economics (PIDE), the U.S. National Center for Health Statistics, Washington, D.C. and The Population Council, New York. Without the financial and technical collaboration of each of these agencies the Population Growth Estimation (PGE) Experiment could not have been conducted. The authors gratefully acknowledge the careful work of the many persons in PGE, CSO and PIDE who helped provide the data that underly this report. The authors also wish to acknowledge with gratitude the comments and suggestions received on the earlier draft from Dr. Warren C. Robinson, a former Research Advisor at the Pakistan Institute of Development Economics, Professor Ansley J. Coale and Mr. Al Hermalin of Princeton University. The findings of this paper do not necessarily represent the official views of the above-mentioned agencies and the authors themselves accept full responsibility for the statistics and conclusions presented herein.

Appendix

TABLE 1
 ABRIDGED LIFE TABLE BY SEX FOR PAKISTAN, 1962
 (Series A : Chandra-Deming Factors included)

| Age in years and sex | Life table death rate | Probability of surviving between age x and x+n | Number of deaths between age x and x+n | Survivors at exact age x | Years lived between age x and age x+n | Total years lived after exact age x | Expectation of life (average number of years lived after exact age x) |
|----------------------|-----------------------|--|--|--------------------------|---------------------------------------|-------------------------------------|---|
| | 1000 n ^q x | n ^p x | n ^d x | l _x | n ^L x | T _x | e _x |
| | (2) | (3) | (4) | (5) | (6) | (7) | (8) |
| Both Sexes | | | | | | | |
