The probability of dying in the highest ages based on an smoothing model.

Until 1986 was the smoothing of probabilities of dying for 91 years and older based on the Wittsteins formula. Between 1987 and 2005 were the probability of dying for ages 91 years and older based on a smoothing method that were developed at Statistics Sweden. In 2012, a review of the smoothing model, which resulted in a small model adjustment and that the smoothing takes place from 95 years of age. In connection with the revision in 2012 were the life tables revised for the years 2006-2011.

The life tables for the years 1980 - 2001 are based on the scanned materials from publications. The scanned material is examined, but it is possible that some figures have been misinterpreted in the process.

For year 1982-1997

The mean population for 100 years refer to all who were 100 years or older.

In 2012, was the method to smooth the probabilities of death for the oldest old changed. In connection with this were previously published life tables for 2006 - 2011 revised.

year:

Average age at death for age zero: Men 0.115 years and Women 0.106 years.
